

Q Destination host unreachable ?

→ If there is no ~~to~~ route for destination IP in system route table, the system/PC will drop directly i.e. ~~the error message~~

Q Request timeout.

If the packet / data is sent from one PC / device to another and the replay from second device to first device is lost because of there is no ~~existing~~ ~~the~~ route present. Then the Request will time out.

Q Replay from some IP destination host un-reachable.

→ That IP device/router will not have a route for that destination IP and the IP's device will drop data
